

PROTEIN

Protein is important for your health AND your healthy weight loss.

When digested, protein breaks down into amino acids which are used for growth and repair everywhere in your body. Amino acids are the building blocks for all our muscles, bones, enzymes, hormones, internal organs, and immune system cells... just to name a few!

Our body can make amino acids, but not all that it needs. We must eat those essential amino acids that we cannot make. They are found in both animal and vegetable foods. Aim for proteins that contain the LEAST amount of carbohydrates when you can!

FOR EXAMPLE:

30 gm protein

4 oz steak or chicken

0 gm net carb

30 gm protein

1.5 cups whole milk greek yogurt

14 gm net carb

30 gm protein

1 3/4 cups lentils

40 gm net carb

30 gm protein

3 3/4 cups quinoa

128 gm net carb

PROTEIN PORTIONS

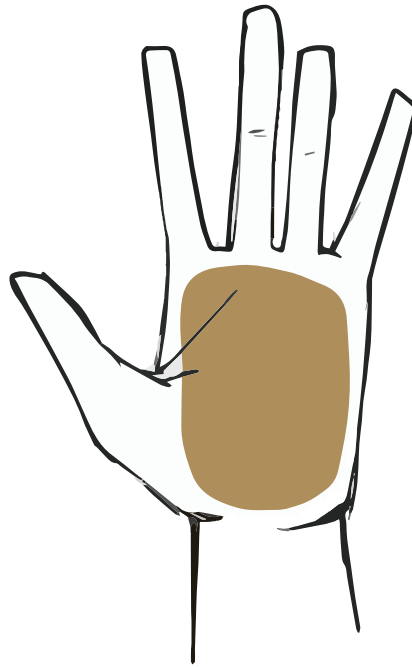

Let's talk serving sizes!

Consuming an adequate amount of protein is essential to support your lean body mass and prevent muscle loss. However, excessive protein intake could lead to unwanted weight gain. If you consume too much protein, your body could be making fat instead of muscle. Generally, our body can only digest about 4oz of protein at a time.

ONE PORTION

15 grams = 2 ounces
1/2 your palm

TWO PORTIONS

30 grams = 4 ounces
Your full palm

Check your book for a complete list of proteins and portion sizes.

Your personal protein needs will likely change throughout your journey. Finding your personal "sweet spot" will vary. Do not be surprised if we ask you to increase or decrease your protein amounts.
